Appl. No. 10/697,581 Amdt. Dated October 25, 2005 Reply to Office action of July 27, 2004

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

22

Claim 1 (currently amended): A bonding method conducted by 1 a bonding device including: a board support table having a 2 plurality of holding portions for individually holding a 3 plurality of boards including at least a first and a second 5 board, the board support table being moved at least in the 6 horizontal direction by a single positioning means; a holding state releasing means for individually releasing a holding state 7 of the board held by the holding portion; a position detecting 8 means for detecting positions of the plurality of boards on the 9 board support table; a plurality of pressure bonding heads 10 arranged corresponding to the respective boards held by the 11 holding portion, for pressure bonding an object to be bonded by 12 pressure to an upper face of each board from an upper portion; 13 and a lower supporting portion for supporting the board from a 14 lower portion in the case of pressure bonding conducted by the 15 pressure bonding head, 16 the bonding method comprising: 17 a step of detecting the positions of the plurality of 18 boards, which are held on the board support table, by the 19 position detecting means; 20 a first positioning step of positioning a first board 21

with respect to a first pressure bonding head corresponding to

Appl. No. 10/697,581 Amdt. Dated October 25, 2005 Reply to Office action of July 27, 2004

the first board by the positioning means according to a result of detecting the positions obtained in the step of detecting the positions;

a first pressure bonding step for pressure bonding an

object to be bonded by pressure to the first board by the first pressure bonding head when the first board, which has been position positioned, is interposed between the first pressure bonding head and the lower receiving portion;

a first holding state releasing step of releasing a holding state of the first board, which is being bonded by pressure, by the holding state releasing means in the first pressure bonding step;

a second positioning step of positioning the second board to the second pressure bonding head corresponding to the second board by the positioning means according to a result of positional detection obtained in the position detecting step after the first holding state has been released; and

a second pressure bonding step of pressure bonding an object to be bonded by pressure to the second board by the second pressure bonding head corresponding to the second board which has been position positioned.

Claim 2 (original): A bonding method according to claim 1, wherein it is judged whether or not it is necessary to execute

- the first positioning step and the second positioning step
 according to the result of positional detection, when it is
 judged that a positional deviation of the board is in an
 allowable range, all boards are positioned with respect to the
 pressure bonding heads corresponding to the respective boards,
 and when it is judged that a positional deviation of the board
 exceeds an allowable range, the step proceeds to the first
 positioning step.
 - Claim 3 (original): A bonding method according to claim 1,
 wherein the holding portion holds the board by means of vacuum
 suction.
 - Claim 4 (original): A bonding method according to claim 1,
 wherein the board is a display panel, and the object to be bonded
 by pressure is an adhesive tape.
 - Claim 5 (original): A bonding method according to claim 1,
 wherein the board is a display panel, and the object to be bonded
 by pressure is an electronic part.
